

BUILT TO WITHSTAND THE JOB.

Lack of long-term adhesion. Tape bonding issues. Tape not sticking, especially in cold and hot environments. Loose tape.

We know...Getting tape to stick to reflective insulation can be difficult. This insulation is often located in unconditioned spaces, exposing the tape to extreme temperatures that can cause flagging or tape failure.

That's why we engineered FF 100, a film tape designed specifically for seaming and sealing reflective insulation. A UL 181B-FX Listed product, FF 100 features an aggressive, all-weather adhesive that forms a permanent bond and can withstand numerous thermal cycles to deliver performance for the life of the system.

With reflective insulation becoming an increasingly popular way to improve HVAC efficiency, having the right tapes in your toolbox to tackle whatever the job demands is critical. Don't just take our word for it! Here's what the pros are saying*:

"The FF 100 tape is easy to use and stays put. This is a tremendous improvement over tapes we have previously used."

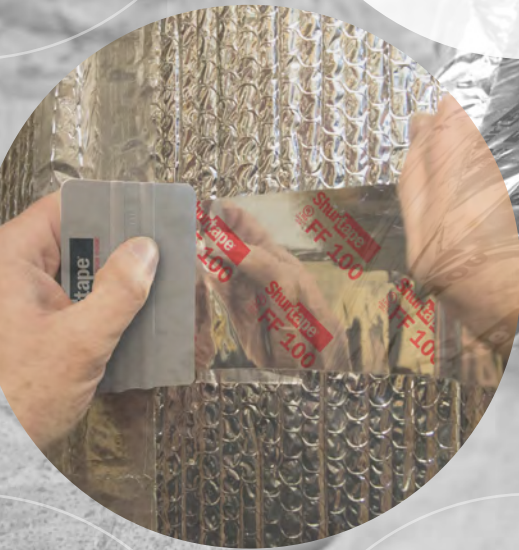

- Douglas B.

"This product was great to work with, was easy to apply and smooth out, and left a great finished look."

- Alan W.

"We received a trial roll of FF 100 and now it's the only type my guys will use."

- Benoist Bros
